

PART 1

BASING AND GROUND TILES

Red Sector provides you with seven new ground tiles to expand your industrial landscape and even venture into the blasted wastes that lie beyond...

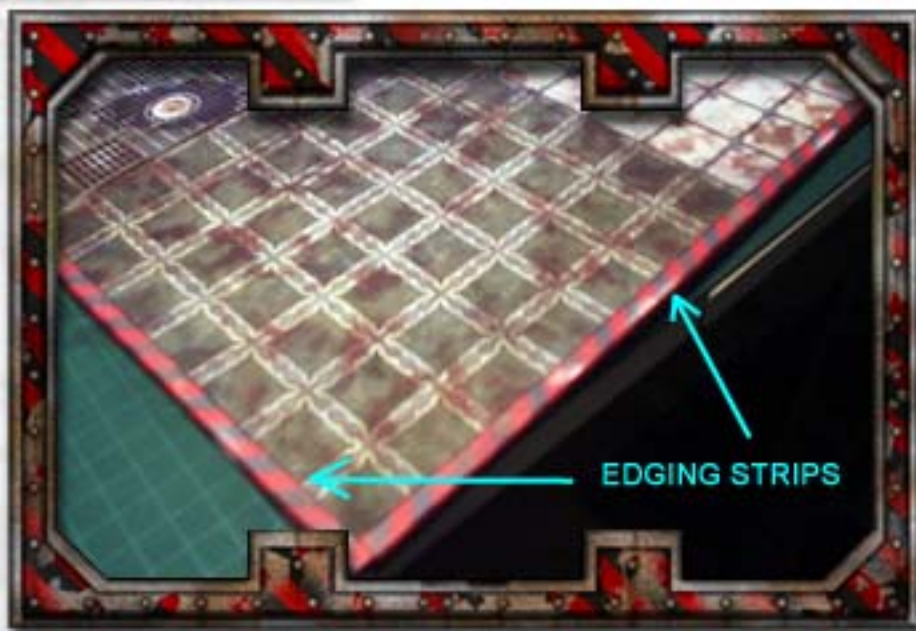

There are three methods that can be used to create ground tiles.

The first is just to cut out a ground tile, glue it to a piece of foamcore and then cut it to size.

Simple! :)

The second is to create a "masterboard" by gluing many groundtiles glued to a single sheet of foamcore (or several sheets of foamcore) to create a single, large playing surface.

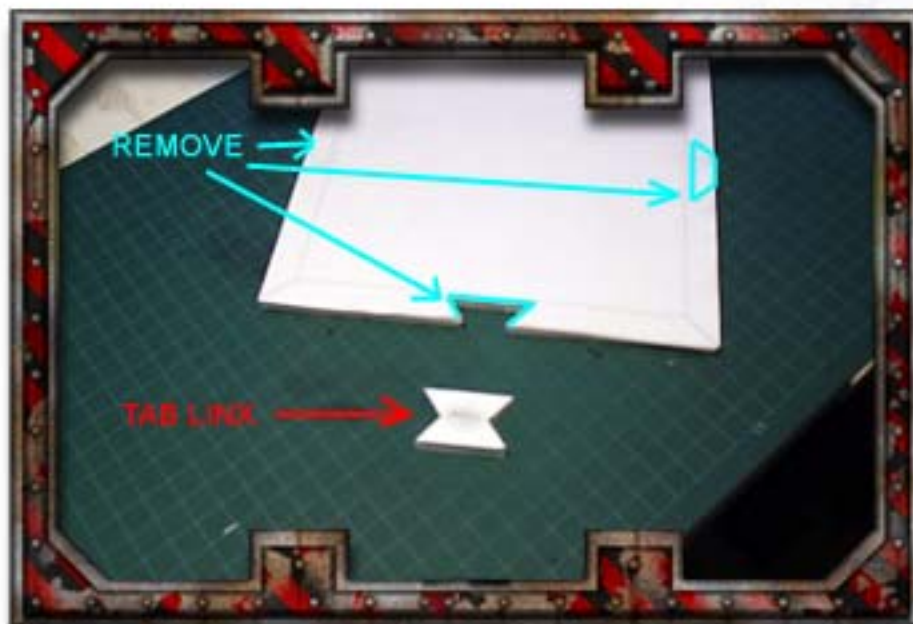

You can tidy up the edges of your masterboard by adding the edging strips provided to the sides.

The third is to create individual tiles as before but this time use the Paperlinx™ system.

Begin by gluing a paperlinx template to a piece of foamcore and cutting it to size.

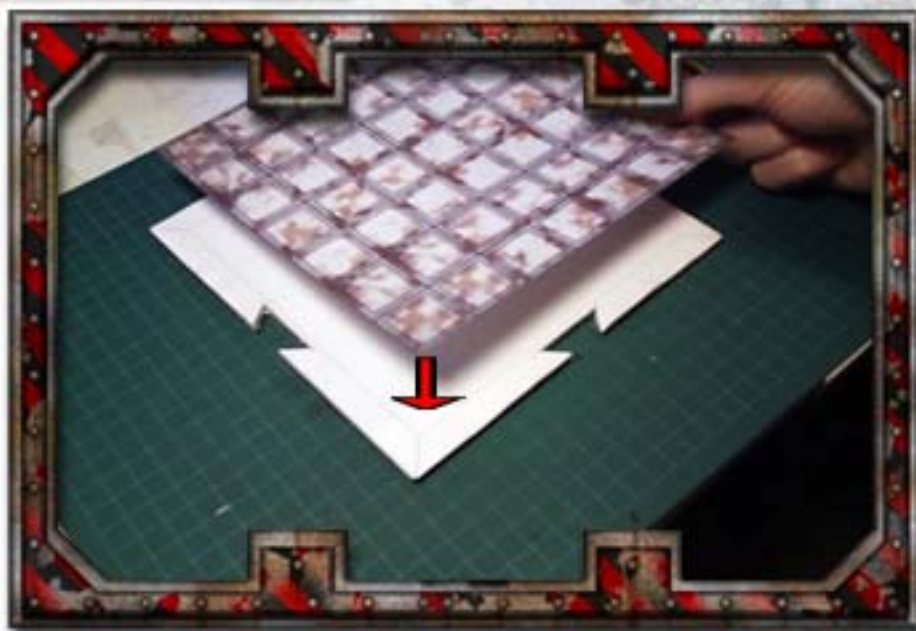

Once the template is dry, carefully remove the wedge shaped slotted areas in the center of each side.

Glue the link tabs to some foamcore and cut them out as well.

When that's done, simply cut out and glue down whatever ground tile you want to use.

Once you have a few tiles you can link them together by inserting one of the tab link in the hole you cut out along each side and then matching it up with the hole in the adjoining tile.
